# secureportal *for school communities*

Secure Portal™ is a software and hardware system that gives students and teachers access to their email, files and school intranet from any computer with an internet connection.

Secure Portal™ provides high level security without additional software or VPN connections. Users just need a current web browser, username and password to access the network through the portal.

When users access the portal, data passes through the demilitarised zone to the Process Control Unit. The Process Control Unit requests data from the network on the users behalf, receives it and then publishes it as HTML. This ensures that data cannot pass directly from the internet to the network, thus maintaining network integrity.

With support for Microsoft® Exchange Server and Microsoft Active Directory®, Secure Portal™ leverages your existing IT investment. The solution is scalable and upgradeable.

## Total Ownership

Unlike other solutions on the market, Secure Portal is owned by the school. There are no recurring fees for hardware or software\*.

## Local Support

Secure Portal™ is developed in South Australia by Terra Electronics. This means you will be supported directly by the company that developed the Secure Portal™ system.

## Secure Portal™ includes:

- Secure Portal™ software licences.
- Hardware from Hewlett-Packard & Watchguard®.
- Configuration for web services and file access for 600 concurrent users (upgradeable to 2000).
- 50 IPSec VPN Licenses - for special access.

\*Internet Web Blocker and Spam Screen require regular upgrades to work effectively.
